SW ROTATE™

The SW Rotate therapeutic mattress replacement system provides full-body lateral rotation of 40 degrees or more. The SW Rotate also provides the standard pressure redistribution therapy of low air loss to prevent and assist in the treatment of skin issues such as pressure ulcers. The newly enhanced SW Rotate provides the added pressure redistribution component of pulsation and an optional respiratory therapy module that allows mechanical percussion and vibration for the immobile patient.

PATIENT TURNING RIGHT ILLUSTRATION

PERCUSSION/VIBRATION

The purpose of chest physiotherapy (CPT) is to help patients breathe more freely and to facilitate oxygen and carbon dioxide exchange in the lungs. Percussion and vibration therapy is used to help break up thick secretions in the lungs by repeatedly stimulating the chest wall. Our percussion and vibration therapy can be programmed to focus on one, two or all three zones of the back, targeting the movement of fluid in the patient's lungs. The programmable therapy cycle can be set for five, ten, or twenty minutes with options for percussion, vibration, or both. This therapy is available on the Big Turn II or SW Rotate in 35", 39", or 48" widths.
